

Objective:

1. Link each of these respective SQL databases in a way that benefits the end user.
2. Retain each database individually or within a cluster to keep access to hard coded apps and functions.

Notes:

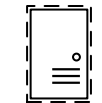

1. There are a total of three (3) Microsoft SQL DB Instances running on dedicated servers.
2. There is one (1) MySQL instance running on a virtual server.
3. All servers reside on the same subnet and are linked by TMC-Core-6500.

Options:

1. Merge tables from OPERATIONSDBSRV and SMS to reduce the SQL instance count to 3.
2. Leave all 4 SQL databases intact and link them using URL href links which would be viewable via a web browser.

Legend:

 = Physical Server

 = Virtual Server
