

**Attention: Please be advised on the location of each network intrusion disconnect placard.**

**Network Intrusion  
Disconnect**

**Buffalo NAS Server**

**Network Intrusion  
Disconnect**

**Cisco Dual WAN Router**

Note: If at any time it is believed that a network connected device has been infected with any form of malicious software these are the quick and easy steps that have been put in place to halt any further damage to the network.

1. **Locate the power disconnect placards.** Operators should be familiar with the location of all placards.
2. **Unplug the power cord from all critical devices.** Disconnect the power source from each respective device to ensure no network connectivity is established.
3. **Inform others about the incident.** Once the power has been disconnected, notify IT of the situation. Understand that the most effective way to prevent network intrusion is to be vigilant.

(As a result of this process, there will be no internet connectivity until the source has been identified and situation has been resolved)
